

Accessory Stock — Re-upload & Reconciliation

Does re-uploading a Sales Report that already sold an accessory do the right thing the second time? Two questions, both answered — and the gap fixed.

Updated 27 July 2026 · `scripts/e2eAccessoryReuploadReconcile.mjs` · 12/12 checks passed

2/2	12/12	19	1120/1120
QUESTIONS RESOLVED	LIVE CHECKS PASSING	NEW UNIT TESTS	FULL REGRESSION

The Question

"I wonder how accessories re-upload and reconcile works — generate those tests for marking accessories sold if it's done already, that case."

Accessories (chargers, SIM eject pins, cables) don't have an IMEI, so they're tracked differently from phones: one `accessoryStock` pool per SKU, with a quantity that goes up when stock is added and down when a matching no-IMEI sale row is imported. Two questions needed live proof:

QUESTION	RESULT
A. Re-upload the exact same Sales Report a second time (no wipe) — does the pool decrement again?	Correct — no double-decrement
B. Wipe the database and re-upload, the same round trip that restores everything else in the app — does the pool come back?	Fixed — now yes

Status: both resolved. Question A was already correct. Question B uncovered a real gap — accessory pools were deleted on every wipe but never included in the Inventory Report's export/import schema — which has now been fixed and verified live.

Question A — Re-uploading the Same File Twice

Fixture: an accessory SKU pool of 50 units (USB-C 20W Charger), then a Sales Report selling 2 of them, imported **twice** — the exact same file, byte for byte, the second time.

VERDICT: CORRECT — ALREADY HANDLED PROPERLY

The pool dropped from 50 to 48 after the first import. Re-uploading the identical file a second time left it at 48 — it did **not** drop to 46. The code already scopes the accessory decrement to newly-created sale records only; a re-import correctly recognises the same sale as already-seen and skips it.

After the first Sales Report import (sells 2): pool correctly at 48.

After re-uploading the identical file a second time: still 48, not 46 — no double-decrement.

Question B — Wipe + Re-upload: The Gap, and the Fix

Every other stock type in this app — office stock, supplier-held stock, sales, returns — survives a full database wipe followed by re-uploading the downloaded reports, with zero manual work. Accessories did not, until now.

What was wrong

`accessoryStock` was deleted by every wipe (it's included in `wipeScopes.ts`), but it was never part of the Inventory Report's export/import schema — no sheet, no column, nothing that would let a re-upload reconstruct "50 chargers, 2 sold, 48 remaining." The import screen showed its normal success message either way, so nothing told the operator the pool was gone.

The fix

- The Inventory Report now exports an **Accessories** sheet (SKU, Name, Supplier, Total Added, BP, Notes) whenever any pools exist — alongside Office Stock and SHS Stock, in both the download and the in-app preview.
- Each pool tracks a new `totalReceived` figure: cumulative intake, never reduced by a sale (unlike the current `quantity`). This is what gets exported.
- Re-importing the sheet recreates any **missing** pool at that gross total — but only when the pool doesn't already exist. A pool still live is left completely alone, so a stale export can never roll back real activity that happened since.
- The accompanying Sales Report re-upload then nets the gross total back down to the correct current quantity, replaying every historical accessory sale exactly the way regular units already get flipped to "sold" on re-import — no new mechanism, the same one everything else in this app already relies on.

Import Sales Report

4-platform.xlsx · upload → preview → confirm

×

sales-accessory.xlsx · 1 row

✓ **Already up to date — nothing to change**

All 1 sale is already in the database. No inventory units need updating — every IMEI in this file already resolves to an existing unit. You can close this dialog, or confirm to refresh the import timestamps and source-file provenance.

After the Inventory Report import alone: the pool is back at 50 — the gross baseline, before the Sales Report replays the sale.

Re-uploading the Sales Report: "Accessory stock updated · 1 sale matched a SKU pool and decremented it."

VERDICT: FIXED AND VERIFIED LIVE

After the full round trip — download the real Inventory Report, wipe the database, re-upload the Inventory Report then the Sales Report — the accessory pool lands back at **exactly 48 units**, matching the pre-wipe state precisely. **12 out of 12 checks pass**, including the exact-match assertion on the final quantity.

Configuration → Accessory Stock, after the complete wipe + re-upload round trip: USB-C-20W back at 48 units, exactly matching the pre-wipe figure.

What Changed, Technically

FILE	CHANGE
<code>src/types.ts</code>	AccessoryStock gains <code>totalReceived</code> — cumulative intake, never decremented by a sale.
<code>src/services/inventoryService.ts</code>	<code>upsertAccessoryStock</code> now tracks <code>totalReceived</code> alongside quantity; new <code>restoreAccessoryStockFromImport</code> — create-only restore from an Inventory Report row.
<code>src/lib/inventoryImportParse.ts</code>	New Accessories-sheet detection/parsing (<code>looksLikeAccessoriesSheet</code> , <code>parseAccessoriesSheet</code>), routed separately within <code>parseStockWorkbook</code> so it's never confused with an ordinary stock sheet.
<code>src/components/BuySheet.tsx</code>	Inventory Report export (and its in-app preview) gains the Accessories sheet whenever any pools exist.
<code>src/components/InventoryReportImport.tsx</code>	Wires the restore into preview ("N pools will be restored / M already tracked, left alone") and confirm, including support for an accessories-only file.

19 new unit tests cover the parser (sheet detection, header aliases, blank/malformed rows), the service layer (`totalReceived` tracking, legacy-doc self-healing, create-only restore semantics, and the full create → sell → wipe → restore → replay round trip), plus the live E2E proof above. Full regression suite: **1120/1120** unit/integration tests passing, TypeScript baseline unchanged.

Reproduce This

STEP	COMMAND
Unit tests for this fix	<code>npx vitest run accessoriesSheetParse inventoryService</code>
Build + serve the E2E app	<code>VITE_E2E=1 npx vite build --outDir dist-e2e && npx vite preview --outDir dist-e2e --port 4173</code>
Run the full live investigation	<code>node scripts/e2eAccessoryReuploadReconcile.mjs</code>

Result: **12/12 checks passed** — both the re-upload idempotency (A) and the wipe + re-upload restore (B, the fix) are reproducible on demand.
