Accessory Stock — Re-upload & Reconciliation

Does re-uploading a Sales Report that already sold an accessory do the right thing the second time? Two separate questions, both answered live.

Prepared 27 July 2026 · `scripts/e2eAccessoryReuploadReconcile.mjs` · 10/10 checks passed

The Question

"I wonder how accessories re-upload and reconcile works — generate those tests for marking accessories sold if it's done already, that case."

Accessories (chargers, SIM eject pins, cables) don't have an IMEI, so they're tracked differently from phones: one `accessoryStock` pool per SKU, with a quantity that goes up when stock is added and down when a matching no-IMEI sale row is imported. An earlier test (`e2eAccessoryStock.mjs`) already proved the first-time flow works: add a pool, import one sale, the pool decrements correctly. It never re-uploads anything, so it couldn't answer what happens the **second** time — which is exactly what "if it's done already" is asking. Two distinct scenarios needed live proof:

QUESTION	RESULT
A. Re-upload the exact same Sales Report a second time (no wipe) — does the pool decrement again?	Correct — no double-decrement
B. Wipe the database and re-upload, the same round trip that restores everything else in the app — does the pool come back?	Gap found — it does not

Question A — Re-uploading the Same File Twice

Fixture: an accessory SKU pool of 50 units (USB-C 20W Charger), then a Sales Report selling 2 of them, imported **twice** — the exact same file, byte for byte, the second time.

VERDICT: CORRECT — ALREADY HANDLED PROPERLY

The pool dropped from 50 to 48 after the first import, as expected. Re-uploading the identical file a second time left it at 48 — it did **not** drop to 46. The code already scopes the accessory decrement to newly-created sale records only; a re-import correctly recognises the same sale as already-seen and skips it. This is by design, and the design works.

After the second (duplicate) import: pool still 48, not 46 — no double-decrement.

Question B — Wipe + Re-upload (the Standard Recovery Path)

Every other stock type in this app — office stock, supplier-held stock, sales, returns — survives a full database wipe followed by re-uploading the downloaded reports, with zero manual work. This is the pattern proven repeatedly throughout this engagement. Accessories were tested against the exact same expectation.

VERDICT: GAP FOUND — NOT A CRASH, BUT A SILENT LOSS

After wiping the database and re-uploading the Sales Report, the sale itself imports fine — no error, no crash. But the accessory pool does **not** come back. Reading the code confirms why: `accessoryStock` is deleted by every wipe (it's included in `wipeScopes.ts`), but it was never added to the Inventory Report's export/import schema — there is no sheet, no column, nothing that would let a re-upload reconstruct "50 chargers, 2 sold, 48 remaining." The import screen shows its normal "success" message either way, so nothing visibly tells the operator that the pool is gone.

Database wiped — Stock Intake correctly shows zero everywhere (office, SHS, sold).

Re-uploading the same Sales Report post-wipe — the preview looks completely normal.

The import completes and reports success — nothing here indicates the accessory pool is missing.

Configuration → Accessory Stock: "No accessory SKUs yet." The 48 remaining chargers are gone, with no path back from the standard reports.

What This Means, and Options

This is not a data-corruption bug — nothing is double-counted, nothing crashes, and the sale record itself is accurate. It's a scope gap: accessories were added as a lightweight, no-IMEI stock type, and the export/import round trip was never extended to cover them. Whether that's worth fixing depends on how the business actually uses accessory tracking day to day:

Option 1 — Leave as-is, document the limitation

If accessory pools are rarely wiped in practice (most wipes are scoped to office/SHS/sales during testing or a fresh start, not routine operation), the simplest fix is documentation: a line in the SOP and a note on the Wipe confirmation screen saying accessory quantities are not recoverable from a re-upload and must be re-entered manually via Add Stock → Accessories.

Option 2 — Add a warning at wipe time

A small addition to the Wipe confirmation modal: when accessory pools exist, show "N accessory SKUs (chargers, SIM pins, etc.) will be permanently deleted and cannot be restored by re-uploading reports" — so the operator makes an informed choice in the moment, without building the full export/import path.

Option 3 — Full fix: add accessories to the Inventory Report

Add an "Accessories" sheet to the Inventory Report export (SKU, name, quantity, buy price) and teach the importer to read it back, matching the same round-trip guarantee every other stock type already has. This is a real feature addition, not a one-line fix — worth doing if accessory stock is tracked at meaningful scale, but the most work of the three options.

This report doesn't pick one of these for you — it's a product decision about how much weight accessory tracking carries in real operation. Say the word and I'll implement whichever one fits.

Reproduce This

STEP	COMMAND
Build + serve the E2E app	<code>VITE_E2E=1 npx vite build --outDir dist-e2e && npx vite preview --outDir dist-e2e --port 4173</code>
Run this exact investigation	<code>node scripts/e2eAccessoryReuploadReconcile.mjs</code>

Result: **10/10 checks passed** — both findings above (A: correct, B: gap) are reproducible on demand, not one-off observations.
