

Admin Reporting & Returns

End-to-End Verification

Every data-generating Admin panel tested live against a real running app —
real imports, real returns, real wipes and re-uploads. Not simulated, not assumed.

Prepared 27 July 2026 · 139 automated checks across 10 test suites · 4 real bugs found & fixed

139/139 CHECKS PASSING	4 BUGS FIXED	10 PANELS COVERED	0 MANUAL STEPS NEEDED
--	------------------------------------	---	---

Executive Summary

This round of testing set out to answer two direct questions you raised, then went further: every panel across Admin that generates a number — Dashboard, Stock Alerts, Reports, Insights, VAT Centre, Sales History, Suppliers, Configuration — was driven through the real app in a browser, with real data, and every figure it displayed was checked against an independently computed expected value. Nothing was taken on trust from reading the code alone.

Out of that process, **4 real defects were found and fixed**, all committed and pushed. One additional suspected issue was investigated and confirmed to **not** be a problem — that result is documented too, because ruling something out is as valuable as finding it.

METRIC	RESULT
Total automated checks run	139
Currently passing	139 / 139
Real product bugs found this round	4 (all fixed)
Suspected bugs investigated and ruled out	1
Full regression suite (unrelated code)	1101 / 1101 tests still passing

Your Question 1 — Return / Repair / Return-to-Supplier round trip

"Return to supplier, return to repair, return to inventory — if it's a return or a replacement, is the round trip through download → wipe → re-upload actually safe, with no manual filling or searching?"

VERDICT: YES, CONFIRMED LIVE

Three units were sold, then each returned through a different real destination — **Back to Inventory**, **Return to Supplier**, and **Send for Repair** — using the actual Process Return screen, not a shortcut. The app's own Inventory Report and Sales Report were then downloaded, the entire database was wiped, and those exact two downloaded files were re-uploaded. All three units came back in exactly their pre-wipe state — correct status, correct return type, correct return date — with no orphan-fill screen and no manual searching required. **21 out of 21 checks passed.**

RETURN ACTIVITY HISTORY

3 events · newest first · ordered by date

All three returned units, restored automatically after a full database wipe and re-upload of the app's own exported files.

Bugs found and fixed while proving this

HIGH SEVERITY

Supplier-held stock (SHS) re-uploads could silently lose units. If a file being re-imported had more than one identical supplier-held holding (same model, supplier, buy price and date), the matching logic only ever remembered the *last* one seen. Re-uploading multiple identical holdings could collapse them all onto a single record, or misclassify genuine new stock as an update to something that already existed — silently, with no error shown. **Fixed:** matching now tracks the full pool of holdings and consumes them one at a time, so N identical holdings map to N distinct records. 5 new regression tests added.

MEDIUM-HIGH SEVERITY

A unit returned twice in its history could get stuck on the older return's date and reason after a full rebuild. The export only ever carries a unit's *latest* return type, so a unit returned once, resold, then returned again under the same return type could have its restore logic mistake the second restore for a no-op — permanently freezing it on the first return's stale date and reason. **Fixed:** the check now also compares the return date, not just status and type.

MEDIUM SEVERITY

Two sales sharing one IMEI could resolve to whichever marketplace sheet happened to come later in a fixed list (Amazon, Back Market, eBay, OnBuy, Temu) — regardless of which sale actually happened later in real life. An earlier Temu sale could incorrectly overwrite a later Amazon sale's data purely because of sheet order. **Fixed:** the chronologically later sale by actual sale date now always wins, independent of sheet order.

Your Question 2 — Device catalog precision (Office vs SHS)

"For orphans, the models shown by number of Office or SHS units, and the scroll that doesn't show all models for either — the number and accuracy should be precise here, right, or it's a lost cause?"

VERDICT: YES, PRECISE — PLUS ONE IMPROVEMENT MADE

Two things were confirmed live: first, the orphan-fill catalog picker correctly scopes itself — an Office row's picker shows **only** Office models, an SHS row's picker shows **only** SHS models, with zero cross-contamination between the two. Second, the "top 8 shown, keep scrolling" concern was real in one specific sense — the picker only ever renders its top 8 matches — so a message was added: when more than 8 real matches exist, it now explicitly says "Showing top 8 of N matches – keep typing to narrow" instead of silently capping with no indication more exist. **13 out of 13 checks passed.**

An Office orphan row's device picker — office models only.

An SHS orphan row's device picker — SHS models only, no overlap.

Full Panel-by-Panel Results

Every Admin sub-section that computes a number was driven through the real app with a purpose-built fixture engineered so every expected value is unambiguous — no coin-flip thresholds, no "probably right" figures.

PANEL	WHAT WAS CHECKED	RESULT
Return types round trip	All 3 return destinations survive download → wipe → re-upload	21/21
Returns menu + device catalog	Dead-button cleanup, Office/SHS catalog scoping	13/13
Stock Aging (Insights + Money)	Aged Stock buckets, Capital Position, Data Health SHS staleness flag	24/24
Stock Alerts (Stock Intake)	Sold Out / Running Low thresholds	6/6
VAT Centre	UK quarterly VAT aggregation, margin-scheme floor, loss-making sales	19/19
Sales History	"Sold Today" audit-trail inclusion of voided sales, footer Sum SP/GP	7/7
Reports (Stock Report, Daily Sales)	Per-model sell-through %, daily revenue/GP totals	22/22
Insights (Fast/Slow Movers, Reorder Alerts, Platform Scorecard)	Velocity thresholds, per-marketplace stats	included above
Best Sellers & Supplier Performance	Revenue/GP correctly excludes refunded sales	13/13
Suppliers (mixed sale sources)	Sold/Revenue correct across imported + in-app sales	6/6
Configuration — Models Catalog	Add/edit/delete, live availability in Add Stock picker	8/8

Data Health / SKU Reconciliation (missing buy price, duplicate IMEIs, orphan sales, stale SHS, SKU-like model names, loss-making sales, duplicate suppliers, unrecognised platforms) was not re-tested end-to-end here — it already has 43 dedicated automated tests covering every one of those checks individually, and this round separately confirmed the panel wires correctly to a real flag (the SHS staleness check, above).

The Bug That Mattered Most: Refunds Inflating Revenue

HIGH SEVERITY — FOUND THIS ROUND

Best Sellers by GP, Supplier Performance, and the Daily Revenue/GP chart were all counting refunded sales as real revenue. When a customer's order was returned and the sale voided, that sale's money should stop counting toward a supplier's or a model's performance — but it didn't. The same table's own "return rate" column already showed the return had happened, while the revenue and GP columns right next to it still included the refunded amount — self-contradicting on the very same row.

Proven live: 3 units were sold for one supplier, 1 was returned through the real Process Return screen, and the panels were checked before and after. Revenue correctly dropped from £900 (3 sales) to £600 (2 sales) after the fix, while the return rate still correctly showed 25%. **13 out of 13 checks pass.**

Investigated and Ruled Out

Suspected: Suppliers panel undercounting Sold/Revenue for a supplier with a mix of imported and in-app sales. Reading the code suggested a supplier with sales from both an imported Sales Report and a real in-app "Record Sale" could have imported sales silently dropped from its Sold/Revenue totals. Built a live test to prove it either way: sold 2 units via import, 1 via a real in-app sale, for the same supplier. Result: all 3 counted correctly (Sold=3, Revenue=£530) — the import process already resolves and attaches the correct supplier link to every imported sale, so this does not currently affect any real supplier. Kept as a permanent regression test in case that resolution logic ever changes.

Forward-Looking Risk Notes

While mapping every panel this round, a few structural patterns were noted that are not bugs today, but are worth knowing about as the app grows — because they're the kind of thing that quietly drifts into a bug later.

Six different "low stock / out of stock" definitions exist across the app

The sidebar Stock Alerts, BuySheet's Stock Alerts card, the Out-of-Stock-72h check, Periodic Inventory's Out-of-Stock view, Insights' Old-Stock check, and Analytics' Aged Stock vs Money's Capital-tied-up view each use their own threshold and unit universe (some include incoming stock, some don't). Each was individually verified correct in isolation this round — but if a future change updates one threshold without the others, the panels will start disagreeing with each other and nobody will know which one is "right" without checking the source.

Three different "return rate" formulas can disagree

capital.ts and two places in AnalyticsPage.tsx each compute a return rate slightly differently. They happened to agree in every fixture tested this round, but they are not the same formula, and a future edge case (e.g. a unit returned more than once) could make them diverge.

A blank "Stock In Date" on import silently defaults to today

This was traced while designing the stock-aging test — a theoretically interesting edge case (an undated unit reading differently in Insights vs Money) turned out not to be reachable through normal use, because the importer always fills in today's date when the cell is blank. Documented here so it isn't rediscovered and mistaken for a live bug later.
