KNOWN OPEN DEFECTS

Executive Summary

This report closes out the production-readiness effort for InventoryManager. It covers the **entire engagement** — not just the most recent testing round — audited directly from the project's full commit history (860 commits, 2026-04-29 to 2026-07-27) and from live, reproducible end-to-end test suites driven against the real running application.

Two things are documented here, deliberately kept separate:

- 1. **Every real bug found and fixed across the whole engagement** — 72 distinct defects, grouped by feature area, each with the commit(s) that fixed it. This is a ledger, not a changelog: feature work, refactors, and screenshot-only commits are excluded on purpose.
- 2. **The current, live-verified state of the application** — every reproducible test suite in the repository, re-run fresh for this report, with the exact pass count each produced. Nothing here is asserted from memory or from old screenshots without being re-checked.

METRIC	RESULT
Distinct bugs fixed, full engagement	72
Commits behind those fixes	~150+ (many bugs took 2-9 follow-up commits to fully resolve)
Reproducible E2E test scripts in the repo	28 (487 checks total, all re-run fresh for this report)
Unit/integration test suite	1101 / 1101 passing
TypeScript baseline	187 pre-existing errors, unchanged (none newly introduced)
Suspected bugs investigated and ruled out	1 (documented, not silently dropped)

How This Report Is Organised

1. Executive Summary	
2. Full Bug Fix Ledger — every defect, by feature area	72
3. Your Two Standing Questions, Answered With Live Proof	
4. This Round's Brutal Admin-Panel Test — Full Results	
5. Full Reproducible E2E Suite — Current Results	
6. Screenshot Evidence	
7. Forward-Looking Risk Notes	
8. How to Reproduce Everything In This Report	
9. Final Verdict	

Full Bug Fix Ledger

Every genuine defect found and fixed across the full engagement, grouped by feature area. Each entry names the commit hash that fixed it — `git show <hash>` on this branch reproduces the exact change. Multi-commit fix-and-refine chains are collapsed into one entry, noting how many commits it took. The full detail behind this section also lives in `docs/verification-reports/FULL_BUG_LEDGER.md` in the repository.

TEMU marketplace integration

ISSUE	WHAT WAS WRONG & THE FIX (COMMIT REFS INLINE)
Temu commission/VAT formula mismatch	(359efe8) — the app's Temu commission/VAT calculation didn't match the client's authoritative export figures; corrected to match the real transaction in the client's final CSV.

Accessory (no-IMEI) stock

ISSUE	WHAT WAS WRONG & THE FIX (COMMIT REFS INLINE)
Earbuds and watches could not be entered into stock at all	(2c3022a) — <code>isAppleDevice</code> 's serial-unlock regex required a word boundary after "BUDS"/"WATCH" that fused model names like <code>Buds2</code> , <code>AirPods4</code> , <code>Galaxy Watch6</code> never had, so these devices had no IMEI to type and no serial path either — a hard dead end on intake. Widened the fused-token pattern (the same class of bug already patched for tablets, never carried across to earbuds/watches).

Returns workflow

ISSUE	WHAT WAS WRONG & THE FIX (COMMIT REFS INLINE)
£0 sale silently bypassed the sales ledger	(3b63e81) — <code>UnitDetailDrawer.markSold</code> accepted <code>salePrice="0"</code> and wrote <code>status:'sold'</code> directly, never creating a <code>sales</code> record — the unit vanished from the Sales Report entirely. Rerouted through the shared <code>recordSale</code> path used by every other sell flow.
Repair-route units stayed "In Repair" forever, injecting phantom postage loss	(f0f8e1e , hardened by a3bf036 — 2 commits) — completing a repair overwrote the unit's <code>returnType</code> from <code>'repair'</code> to <code>'returned_to_inventory'</code> , so every downstream renderer fell back to the "refund" default and charged 2 phantom shipping legs. Moved the signal onto the immutable Sale doc and extracted the write logic to a pure, unit-tested helper.
Inventory Report overstated stock by soft-deleted (returned-to-supplier) units	(3888ba1) — the export showed 211 rows vs. 210 on the live KPI because a <code>returned_to_supplier</code> unit slipped past a <code>status==='sold'</code> -only filter; fixed with a shared <code>isStockOnHand()</code> predicate used everywhere.
Return-restore idempotency check clobbered an older cycle's date/reason	(99cae57) — a unit returned twice in its history, sharing the same return type across both cycles, could get permanently stuck on the first cycle's stale date and reason after a full wipe+rebuild.
Return-restore could clobber a unit resold under a newer order	(8b82c98) — guarded against overwriting a newer sale's state with an older return's data.

48 returned units silently lost during an earlier re-import incident	(d2c04ec) — folded return history into the Sales Report itself so a re-upload replays a voided sale's return state back onto its unit instead of losing it.
Re-imports were silently erasing existing returns	(a9f6f2e) — a Back-to-Inventory unit (status 'available') matched the same "returned" skip-list gate as a true return, so re-uploading a Sales Report dragged it back to sold and nulled its return fields, restoring refunded revenue as if it hadn't been returned.
Multi-cycle return state incorrectly carried over on re-sale	(0152b8a , with downstream symptoms patched in 4df31ca and 73fba21 — 3 commits) — recordSale never cleared stale return fields on a unit going sold → returned → re-sold, leaving dual, contradictory state that broke Sold Today counts and cross-screen KPI consistency.
Returns/Sales Report silently dropped voided/returned sales, hiding real postage exposure	(bcc932d) — the downloaded Sales Report filtered out !s.voidedAt , so accountants never saw the return rows or cumulative loss across multiple cycles on one unit; every voided sale now ships in the workbook, flagged, with its Postage Loss.
GP % overstated profitability on refunded/replaced sales	(b34c518) — the GP% column ignored the 2–3 shipping legs already tracked in the separate Postage Loss column, so a sale that actually lost money could read as +12% GP.
Returns/sales tallies double-counted or disagreed screen-to-screen	(4 commits: 70d438b , af6c18e , 164af94 , f162728) — Sales Summary and Returns Summary counted duplicate void sub-records instead of deduping; Sell tile "Returned" chips counted return *events* while the Returns page counted physical *units*, so one unit cycled sold → returned → re-sold → returned showed "2" on one screen and "1" on the other. Resolved with a consistent earliest-void-date-per-unit model (one commit in the chain was an intentional revert after the operator clarified they wanted event counts on that one specific tile).
A prior commit had wrongly auto-voided "red flagged" sales rows	(dd9a412 , self-correcting dc2d798) — red highlighting was meant to be a soft visual annotation, but the previous commit had been auto-stamping voidedAt , silently dropping those rows out of GP/revenue rollups as if confirmed refunds.
Units stuck in a status that made them un-sellable	(6198c67) — ProcessReturn wrote status and returnType in one call; a partial write race could leave a unit correctly flagged as returned-to-inventory but still status= ' returned ' , so the Returns page showed it available while Buy/Sell screens hid it entirely.
Sales counting double-counted / lost re-sold units	(7d07387 , 4df31ca) — the Sell screen's sale-counting logic double-counted in one case and dropped re-sold units in another.
Dead-end return actions left on finished returns	(3811c68 , 5e3d53c — 2 commits) — "Send to Repair" / "Re-process Return" stayed clickable on already-finished return records.
Sales Report failed to surface returns when Sale.voidedAt wasn't written	(86cd766) — a return could complete without the void flag ever landing on the Sale doc.
Duplicate-IMEI cross-marketplace race	(99eab03) — two sales sharing one IMEI resolved to whichever marketplace sheet came later in a fixed list (Amazon/BM/eBay/OnBuy/Temu), regardless of actual sale chronology; now the chronologically later sale always wins.
Refunded sales inflating Best Sellers / Supplier Performance /	(3b6f2b3) — those panels' revenue/GP totals never excluded voided sales, self-contradicting their own "return rate" column on the same row.

Daily Revenue

SHS (supplier-held stock)

ISSUE	WHAT WAS WRONG & THE FIX (COMMIT REFS INLINE)
SHS templates/importer wrongly required an IMEI	(9bf1a90) — supplier-held stock hasn't shipped and has no IMEI, but the template's own instructions said IMEI was required — making the template unusable without inventing fake IMEIs.
SHS counts disagreed across the Buy and Sell tabs	(4 commits: d05e392 , e12a2e4 , 5fa6634 , fb17549) — the same data produced two different totals because each screen computed the count with its own formula; a manual-SHS unit ID prefix mismatch also made manually-added SHS units invisible to the KPI. Consolidated into one shsCount.ts source of truth.
SHS stock wasn't excluded from Office Stock KPI or out-of-stock alerts	(5f9fb8e , 5fa6634) — incoming SHS units counted as available office stock, and SKUs with SHS coverage still fired false "Sold Out / Reorder" alerts.
SHS row import silently landed as regular available stock	(f9bc78c) — the 9-column schema had no field to mark "supplier still holds this," so every SHS row imported as available office stock.
Sales couldn't fulfil against SHS units	(74b05e3) — a sale against SHS stock left the unit stuck at status='incoming' instead of fulfilling it.
Selling an SHS unit without a new IMEI cleared its existing IMEI	(7ccd3ce).
SHS placeholder units became permanent phantoms, inflating the SHS KPI	(2ba8733) — selling SHS stock before formal receipt left the placeholder unit stuck forever, double-counting inventory.
Silent data loss re-uploading multiple identical SHS holdings	(03b75c2) — a single-slot matching map only remembered the last of N identical holdings; fixed with a pool-based consumption model so N holdings map to N distinct records.
ReceiveSHSModal crashed on the first keystroke	(b49bd68).

Sales / Reports figures

ISSUE	WHAT WAS WRONG & THE FIX (COMMIT REFS INLINE)
Admin → Reports double-counted revenue	(31e131e) — showed 194 sold / £88.8k instead of the correct 101 sold / £45.7k.
Every imported sale was attributed to one fake supplier	(4f8bc0d , root-caused and fixed at the import layer by 9a474a8 — 2 commits) — the real cause was upstream in salesImport , which produced only a supplierName with no supplierId for any consumer to join on. Fixed so SalesReportImport resolves and writes supplierId at import time; duplicate suppliers are now refused outright.
Sales History listed every imported sale twice	(dea20b3).

Platform Scorecard read zero on every imported sale	(d4a8a0c).
Two conflicting VAT figures on two different screens	(301f131 , c7b1c85 — 2 commits) — Reports carried a second, duplicate VAT engine on a rolling 90-day window with locally recomputed fees (matching no real filing period), while the VAT Centre computed a per-sale figure but never totalled it — so the one number needed to file was never produced anywhere. Consolidated to one authoritative, totalled VAT figure.
Sales Report export/import schema disagreed with itself	(f9773f7 , 63d39a5 — 2 commits) — Amazon's positional fallback read <code>postage</code> from the Comments column index instead of Postage's — any file with a renamed/stripped Postage header silently parsed free text as £0 postage, overstating GP by exactly the postage amount on every affected row; the inventory export also had Colour and SIM Type transposed vs. the import template.
NP (Net Profit) column blank for ~90% of Sales Report rows	(b460b20) — <code>calcSaleFinancials</code> only ever set <code>netProfit</code> for eBay; other marketplaces rendered blank instead of falling back to Gross Profit.
Sale financial formulas didn't match the client's authoritative master spreadsheet	(8-commit saga: 7d8256b , 78908f8 , 994293b , bc7237c , 367bc2e , 533fd94 , b682473 , 308b42b , eeeb3a8) — systematically wrong figures across all four original marketplaces: Amazon commission computed on the wrong base, intermediate values rounded before use (compounding penny errors), GP% using the wrong denominator, and several marketplaces missing per-line VAT/Marketing/DSF/Customer-Care-Fee/Accessories components the master sheet accounted for. Fully reconciled with a 48-row master-fixture parity test suite.
bulkUpsertSales silently discarded the correct sale ID, collapsing multi-item orders	(2694562) — re-derived the doc ID on every write, silently overriding the parser's carefully-built composite ID, leaving an earlier fix for this exact symptom (6471bae) inert on two of the app's write paths.
Multi-phone orders collapsed into a single sale record	(6471bae) — the parser's composite Sale ID didn't include IMEI/SKU, so a multi-unit order overwrote itself down to one row.
Sales writes failed on Firestore-illegal ID characters	(a867259) and recordSale 's ID scheme didn't match the importer's (69b92cb) — both part of the composite-ID correctness effort.
Sales import never touched the matching inventory unit	(50ec8bb) — imported sales left the matching IMEI showing <code>status='available'</code> even though it had sold, and left <code>sale.unitId</code> blank, so every buy-side column (Model/Grade/Storage/Colour/etc.) rendered "—" for imported sales in the ALL sheet.
cleanForFirestore silently stripped supplierName on every write	(6158e6f).
BP (buy price) computed as £0 on every imported unit	(df7014f , same root cause zeroing SP/Postage/Commission on the sales side, 2b0096b — 2 commits) — <code>Math.max(findCol(...), 4)</code> clobbered a correctly-found column index of 3 back to 4, so the parser read the Colour column as a price and <code>parseFloat("SPACE GREY")</code> silently became 0.
Re-uploading the app's own Sales Report always flagged 4 invalid rows	(8458974) — a self-consistency bug in the audit-completion gate.
Imported sale dates drifted back one day for IST (+05:30)	(76973d5) — a timezone conversion bug silently shifted every imported sale's date.

users

"Returned Today = 394" bug	(9250420) — an absurd, clearly-wrong KPI figure caused by a save-path failure.
Dashboard stock value KPI included non-available units	(8094b19) — fixed to available-only.
Reorder Alerts mismatch	(a21255b) — sell-through metrics and average sell time were missing/wrong, causing alerts to disagree with actual stock state.
QA batch of production fixes	(d1ca705) — <code>bulkCreate</code> silently failed for >500-unit imports (Firestore batch limit not chunked); <code>subscribeToCollection</code> used an ordering field that errored on non-inventory collections; <code>resetDatabase</code> only cleared 2 of 7 collections; a brand-detection bug where every model read as "iPhone" regardless of actual model.
5 master-file → Firestore import gaps from a coverage audit	(32afd30) — <code>MARKETPLACE</code> , <code>STOCK OUT DATE</code> , verbatim <code>STATUS</code> values, the Supplier WhatsApp Updates sheet, and an unlabeled notes-flag column were all silently dropped by the parser.

Admin restructure / Data Health / Device & model catalog

ISSUE	WHAT WAS WRONG & THE FIX (COMMIT REFS INLINE)
Periodic table tile count disagreed with its own overlay (316 vs. 116)	(24dacb6 , same-day correction db0a94d — 2 commits) — tiles and their drill-down overlay used different key derivations for the same model bucket.
False-duplicate tiles in the periodic table	(39a0ced) — normalization gaps split one model into separate tiles; also fixed XCover model-number labels reading as a quantity.
Apple Watch tile opened to "0 rows"	(6f42ef6) — a case-mismatch bug in the tile-to-overlay filter.
Periodic-table overlay matched Galaxy S20 rows into the S20 FE tile	(83336a0) — an exact-match filtering bug conflating two distinct models.
"Brand New" vs. "Brand new" treated as two different values	(aafc9c8).
Inventory Report re-import could match units across the wrong stock bucket	(679d5f6) — office and SHS rows could cross-match during re-import.
Model picker showed a misleading empty-state count	(18b8648) and wasn't filtered by its own row's Office/SHS toggle (d662093) — orphan-row resolution during import could offer or apply models from the wrong stock bucket.
Model picker silently capped results at 8 with no indication more existed	(f6fb640) — added "Showing top 8 of N matches — keep typing to narrow."
Sales audit gate accepted placeholder/legacy-format IMEIs as valid	(28604fd).

Import blocked by "Missing or insufficient permissions"	(7501f34) — fixed by writing a consistent <code>ownerId= 'shared' </code> .
Client Walkthrough data-reconciliation effort	(~15 commits: de2a965 S9/S9+ collision, 0e6dab4 S21+ rename, 9a1c210 COLOURS ↔ SUPPLIER column swap across 42 rows, plus row-by-row resolutions for iPhone XS/SE, Galaxy Tab A8/S9FE/S20FE) — a live, in-meeting audit found the inventory sheet and the IMEI numbers sheet disagreed on colour, supplier and model naming for dozens of specific units, all individually verified and corrected.

Analytics / Insights KPIs

ISSUE	WHAT WAS WRONG & THE FIX (COMMIT REFS INLINE)
Sold Today / Returned Today counted by UTC calendar day instead of a rolling 24h window	(8b3f87b) — wrong daily figures for any operator not in UTC.
Out-of-stock tile corner badge showed the lifetime-sold count instead of 0	(5dd6137).
72-hour "Stock Added" KPI filtered on <code>createdAt</code> instead of Stock-In date	(c780687).

Notifications

ISSUE	WHAT WAS WRONG & THE FIX (COMMIT REFS INLINE)
Notification duplication / lifecycle bugs	(~8 commits: bf2e677 , 79d765d , 1dc9925 , e974d54 , 38c319e , 074fea5 , 10371c0 , 9a486ff) — notifications re-fired on reload instead of deduping against fire history; "Clear" removed notifications younger than 24h instead of only older ones; unread badge count reset incorrectly when the auto-close banner disappeared; the loss-sale trigger fired incorrectly; toast notifications rendered fully transparent in one regression.

Stock Alerts ticker

ISSUE	WHAT WAS WRONG & THE FIX (COMMIT REFS INLINE)
Duplicate/incorrect out-of-stock and low-stock alerts	(~5 commits: 405b7bb , fda8e85 , a79fcd2 , 21306cf , d8257b6) — the scrolling ticker rendered the same alert multiple times (an animation-loop rendering the array twice), and separately failed to properly detect out-of-stock/low-stock conditions in an earlier iteration.

Stock intake — image capture / OCR pipeline (early build)

ISSUE	WHAT WAS WRONG & THE FIX (COMMIT REFS INLINE)
Image capture and OCR blocked stock intake outright	(~10 commits across the project's first weeks: 64edfd7 P1 incident — image picker/file selection failure, e7129a9 / 13fdcc4 file input not triggering on mobile, ca333e2 OCR worker null-pointer crash, 982dc3a OCR Worker DataCloneError,

e10b1e1 OCR worker serialization failure, 40e172e Cloudinary 401 upload error, 8812da7 / 177e79f null-IMEI crash) — a series of defects that made "add stock by photo" crash or silently do nothing, resolved before the team settled on Firebase Storage for images.

Data layer reliability

ISSUE	WHAT WAS WRONG & THE FIX (COMMIT REFS INLINE)
New devices/fresh sessions showed blank data, or old sessions lost data on reload	(~15 commits spanning the Firebase → Supabase → Firestore migrations: ae93267 stop clearing localStorage, 6dfd12c immediate data load on subscribe, eb88f78 / 90679d2 stale localStorage flash on seed/reset, d26ad11 blank seed data after wipe, dd0b44b Firestore quota/query-limit overflow, eea53e3 infinite loading from a missed endSeeding() path, 397aa0e stuck loading screen, 4ada9d7 / 263e1d3 "SAVING..." hang, 40b691a onSnapshot wiping local cache, 0e99f7f non-self-healing subscription, 8fd2044 "bulletproof new-device loading") — a long-running class of data-loss/hang bugs, stabilized incrementally across three backend migrations before settling on Firestore.

Other

ISSUE	WHAT WAS WRONG & THE FIX (COMMIT REFS INLINE)
Excel duplicate-import	(7127d33 prevents it, ab4a97b surfaces a warning) — 2 commits, one root issue: re-uploading the same file created duplicate units.
bulkCreate / bulkDelete cache-stomp and silently-failing deletes	(6ff2402).
Crash reading .postage on an undefined calcSaleFinancials result	(12867b2). --- ### Investigated and ruled out (not a bug)
Suppliers panel Sold/Revenue undercounting for mixed import + in-app sales sources	suspected from a stale code comment; proven live to be correct current behaviour (SalesReportImport.tsx already resolves a real supplierId at import time). Kept as a permanent regression test (e2eSupplierSoldRevenueMixedSourceBrutal.mjs). ### Scope notes Excluded from this ledger even though flagged by keyword search: pure UI/UX redesigns and rebrand commits, "Refresh E2E screenshots" / "Add E2E proof" commits (test evidence, not fixes), typecheck/build-only fixes with no runtime behaviour change, and deliberate product-behaviour reversions where the "old" behaviour wasn't wrong, just not what the operator wanted.

Investigated and ruled out (not a bug): Suppliers panel Sold/Revenue undercounting for a mix of imported + in-app sales — suspected from a stale code comment elsewhere in the codebase, proven live to be correct current behaviour. Kept as a permanent regression test rather than silently dropped from this record.

Your Two Standing Questions, Answered With Live Proof

1. Return / Repair / Return-to-Supplier round trip

"Return to supplier, return to repair, return to inventory — if it's a return or a replacement, is the round trip through download → wipe → re-upload actually safe, with no manual filling or searching?"

VERDICT: YES, CONFIRMED LIVE

Three units were sold, then each returned through a different real destination — **Back to Inventory**, **Return to Supplier**, and **Send for Repair** — using the actual Process Return screen, not a shortcut. The app's own Inventory Report and Sales Report were then downloaded, the entire database was wiped, and those exact two downloaded files were re-uploaded. All three units came back in *exactly* their pre-wipe state — correct status, correct return type, correct return date — with no orphan-fill screen and no manual searching required. **21 out of 21 checks passed.**

2. Device catalog precision (Office vs SHS)

"For orphans, the models shown by number of Office or SHS units, and the scroll that doesn't show all models for either — the number and accuracy should be precise here, right, or it's a lost cause?"

VERDICT: YES, PRECISE — PLUS ONE IMPROVEMENT MADE

The orphan-fill catalog picker correctly scopes itself — an Office row's picker shows **only** Office models, an SHS row's picker shows **only** SHS models, with zero cross-contamination. The "top 8 shown, keep scrolling" concern was real in one specific sense — the picker only ever renders its top 8 matches — so a message was added: when more than 8 real matches exist, it now explicitly says "Showing top 8 of N matches – keep typing to narrow" instead of silently capping with no indication more exist. **13 out of 13 checks passed.**

An Office orphan row's device picker — office models only.

An SHS orphan row's device picker — SHS models only, no overlap.

This Round's Brutal Admin-Panel Test — Full Results

Every Admin sub-section that computes a number was driven through the real app with a purpose-built fixture engineered so every expected value is unambiguous.

PANEL	WHAT WAS CHECKED	RESULT
Return types round trip	All 3 return destinations survive download → wipe → re-upload	21/21
Returns menu + device catalog	Dead-button cleanup, Office/SHS catalog scoping	13/13
Stock Aging (Insights + Money)	Aged Stock buckets, Capital Position, Data Health SHS staleness flag	24/24
Stock Alerts (Stock Intake)	Sold Out / Running Low thresholds	6/6
VAT Centre	UK quarterly VAT aggregation, margin-scheme floor, loss-making sales	19/19
Sales History	"Sold Today" audit-trail inclusion of voided sales, footer Sum SP/GP	7/7
Reports + Insights	Per-model sell-through %, daily totals, velocity thresholds, Platform Scorecard	22/22
Best Sellers & Supplier Performance	Revenue/GP correctly excludes refunded sales (bug found & fixed this round)	13/13
Suppliers (mixed sale sources)	Sold/Revenue correct across imported + in-app sales	6/6
Configuration — Models Catalog	Add/edit/delete, live availability in Add Stock picker	8/8

Bug found and fixed this round: Best Sellers by GP, Supplier Performance, and the Daily Revenue/GP chart were all counting refunded sales as real revenue. Proven live: 3 units sold for one supplier, 1 returned through the real Process Return screen — revenue correctly dropped from £900 (3 sales) to £600 (2 sales) after the fix, while the return rate still correctly showed 25%.

Evidence

Insights → Aged Stock — all four age buckets exact against a fixture engineered with units at 5/20/45/75/110 days.

Money → Capital Position — includes supplier-held stock in its buckets, unlike Insights (documented, deliberate difference).

VAT Centre — Q3 2026, independently re-derived from the actual per-sale VAT fields in the database.

Returns Workflow — Architecture Reference

The returns workflow is the most complex, most-fixed subsystem in the ledger above (18 distinct defects across the engagement). This diagram, maintained alongside the code, shows the full state machine every returned unit passes through — role gating, the atomic Firestore transaction that guards concurrent updates, and all three outcomes (Refund, Replacement, Repair) with their exact field-level effects.

Source: [docs/returns-workflow.md](#) / [docs/draw_returns_diagram.py](#).

Full Reproducible E2E Suite — Current Results

Every one of the 28 end-to-end test scripts currently in `scripts/` was re-run fresh, from a clean database, against the current codebase, specifically for this report — not copied from an earlier run. Two scripts (marked below) needed a longer timeout than this sweep's per-script cap on the first pass; both were re-run individually afterward and confirmed fully passing.

SCRIPT	WHAT IT COVERS	RESULT
<code>e2eAccessoryStock.mjs</code>	No-IMEI accessory (chargers, SIM pins) stock flow	11/11
<code>e2eAdminDeepDive.mjs</code>	Sales History / Reports / Insights checked against real data, not headings	31/31
<code>e2eAdminDeleteAndQc.mjs</code>	Admin delete (office+SHS), sold-unit delete guard, employee has no delete control	14/14
<code>e2eAdminFunctional.mjs</code>	Admin write actions actually driven (not just render checks)	16/16
<code>e2eAdminSections.mjs</code>	5-section Admin restructure, each section reachable and correct	29/29
<code>e2eBatchVsMarketplace.mjs</code>	Combined 4-sheet workbook vs. one-file-per-marketplace reconcile identically, then restore from downloads	27/27
<code>e2eDeviceComboWidth.mjs</code>	Model picker dropdown readable in a narrow grid column	7/7
<code>e2eInventoryImportBucketScope.mjs</code>	An OFFICE-tagged import row never touches an SHS unit	9/9
<code>e2eModelPickerBucketFilter.mjs</code>	Orphan-row model picker only offers models from its own Office/SHS bucket	17/17
<code>e2eModelsCatalogCrudBrutal.mjs</code>	Configuration → Models Catalog add/edit/delete, live in Add Stock picker	8/8
<code>e2eReportRoundTrip.mjs</code>	What you see matches what you uploaded, cell for cell	17/17
<code>e2eReportsInsightsBrutal.mjs</code>	Stock Report sell-through %, Daily Sales, Fast/Slow Movers, Reorder Alerts, Platform Scorecard	22/22
<code>e2eReturnRestoreOnReimport.mjs</code>	A re-uploaded Sales Report puts a return back where it belongs	37/37
<code>e2eReturnTypesRoundTrip.mjs</code>	All 3 return destinations survive a real download → wipe → re-upload	21/21
<code>e2eReturnsMenuAndDeviceCatalog.mjs</code>	Dead-button cleanup on finished returns + Office/SHS catalog scoping	13/13

e2eSalesHistoryVoidedInclusionBrutal.mjs	Sell tab vs. Sales History voided-sale inclusion, footer Sum SP/GP	7/7
e2eScreenshots.mjs	Every operator surface renders without error	29/29
e2eShsOrphanFlow.mjs	Direct-shipment / supplier-fulfilled orphan walkthrough	14/14
e2eStockAgingPanelsBrutal.mjs	Aged Stock buckets + Capital Position, hand-computed fixture	24/24
e2eStockAlertsBrutal.mjs	Sold Out / Running Low thresholds (Stock Intake)	6/6
e2eSupplierAndBestSellersBrutal.mjs	Best Sellers by GP + Supplier Performance exclude refunded sales	13/13
e2eSupplierSoldRevenueMixedSourceBrutal.mjs	Supplier Sold/Revenue correct across imported + in-app sales	6/6
e2eTemplateDownloads.mjs	Standard templates reachable and correctly parsed from inside the app	12/12
e2eTemplateFillAndUpload.mjs	The shipped templates, filled exactly per the SOP, upload correctly	17/17
e2eTemuMarketplace.mjs	Temu (5th marketplace) commission/VAT against the client's final export	21/21
e2eUploadFlow.mjs	The operator's full daily round trip: wipe, upload, sell, return	29/29
e2eVatCentre.mjs	VAT figure from real imported data matches the sales actually imported	11/11
e2eVatCentreBrutal.mjs	VAT Centre quarterly aggregation, margin-scheme floor, loss-making sales	19/19
TOTAL — every reproducible E2E script currently in the repository		487/487

Full regression suite alongside this: **1101/1101** unit/integration tests passing, TypeScript baseline unchanged at 187 pre-existing errors (0 newly introduced).

Forward-Looking Risk Notes

While mapping every panel this round, a few structural patterns were noted that are not bugs today, but are worth knowing about as the app grows — because they're the kind of thing that quietly drifts into a bug later.

Six different "low stock / out of stock" definitions exist across the app

The sidebar Stock Alerts, BuySheet's Stock Alerts card, the Out-of-Stock-72h check, Periodic Inventory's Out-of-Stock view, Insights' Old-Stock check, and Analytics' Aged Stock vs Money's Capital-tied-up view each use their own threshold and unit universe (some include incoming stock, some don't). Each was individually verified correct in isolation this round — but if a future change updates one threshold without the others, the panels will start disagreeing with each other and nobody will know which one is "right" without checking the source.

Three different "return rate" formulas can disagree

capital.ts and two places in AnalyticsPage.tsx each compute a return rate slightly differently. They happened to agree in every fixture tested this round, but they are not the same formula, and a future edge case (e.g. a unit returned more than once) could make them diverge.

A blank "Stock In Date" on import silently defaults to today

This was traced while designing the stock-aging test — a theoretically interesting edge case (an undated unit reading differently in Insights vs Money) turned out not to be reachable through normal use, because the importer always fills in today's date when the cell is blank. Documented here so it isn't rediscovered and mistaken for a live bug later.

The engagement's bug history clusters heavily around import/export round-trips and cross-screen consistency

Looking at the full ledger, the single largest recurring failure PATTERN (not one bug, a shape) is: two screens computing the "same" number from different code paths, or a re-import silently disagreeing with the state it's supposed to restore. That pattern has been fixed every time it's surfaced, but it is the one to watch for first when something looks "off" in the future — check whether two independent implementations of the same figure exist before assuming a data problem.

How to Reproduce Everything In This Report

Every check in this report can be re-run by anyone with this repository — nothing here depends on a live database, external credentials, or manual steps.

STEP	COMMAND
1. Run the unit/integration test suite	<code>npx vitest run</code>
2. Type-check	<code>npx tsc --noEmit -p .</code>
3. Build the E2E-mode app (uses an in-browser data shim, no credentials needed)	<code>VITE_E2E=1 npx vite build --outDir dist-e2e</code>
4. Serve it	<code>npx vite preview --outDir dist-e2e --port 4173</code>
5. Run any test script	<code>node scripts/<scriptName>.mjs</code>
6. Run everything	<code>for f in scripts/e2e*.mjs; do node "\$f"; done</code>

Each script writes its own fixture workbooks to `e2e-screenshots/<test-name>/fixtures/` and its own screenshots alongside them — every image in this report was produced this way, by the script named in its caption, and can be regenerated identically at any time.

Final Verdict

Across the full engagement: 72 distinct defects were found and fixed, spanning every major subsystem (returns, supplier-held stock, sales/reports figures, the admin restructure, data reliability, and the early image-capture pipeline). Every one of them is backed by a commit that can be inspected directly. This round's exhaustive pass through every data-generating Admin panel found and fixed one further real defect (refunds inflating Best Sellers/Supplier Performance), investigated and ruled out one suspected issue, and re-confirmed that both of your standing questions — return-type round-trip safety and device catalog precision — hold true under live, adversarial testing.

The full reproducible test suite — all 28 end-to-end scripts (487/487 checks) plus 1101 unit/integration tests — passes cleanly against the current codebase, with zero new TypeScript errors introduced. There are no known open defects at the time of this report.

SIGN-OFF ITEM	STATUS
All 72 historical bugs fixed and reproducible via commit reference	Confirmed
This round's brutal Admin-panel sweep (139 checks)	139/139 passing
Full historical E2E suite re-run fresh for this report	See results table above
Unit/integration regression suite	1101/1101 passing
TypeScript baseline	Unchanged (187 pre-existing, 0 new)
Outstanding known defects	None
